NC π^0 background for $\nu_{\mu} \rightarrow \nu_{e}$

- The NC energy distribution is independent of ν -energy except the kinematic limit.
- In $\nu_{\mu}N \to \nu_{\mu}N\pi^0$ events all energy ν produce peak at the same energy except the tail.
- For a very long baselines and wide band beam ν_e signal will be above 3 GeV with little π^0 background.
